Itinerary Audio Bot : Antigravity Guide

Ready to build with **Google Antigravity**? This walkthrough will help you get started step by step, installing Antigravity, opening your workspace, and watching an AI agent set up and run a complete project for you. The screenshots and visuals included come directly from the Antigravity environment, so you can follow along confidently without second-guessing any step.

What is Antigravity?

If you've used traditional IDEs like VS Code, you know they give you autocomplete suggestions but expect you to type each command yourself. Antigravity takes a different approach. Released in November 2025, it's a free, AI-powered development environment built around autonomous agents. You don't have to remember every command; instead, you describe the goal—"Install dependencies and run the app"—and an agent plans and executes the steps for you. Multiple agents can collaborate, and you can monitor them through the Agent Manager panel. Think of it as having a helpful assistant who reads documentation, runs commands and reports back, letting you focus on creativity.

Antigravity also includes a browser for live app previews and a terminal panel, so you can watch your bot come to life. It's perfect for demonstrations because learners see the environment being set up in real time while staying in control through review prompts.

Installing Antigravity

Installing Antigravity is straightforward, and you can let the agent handle most of the heavy lifting. Follow these steps:

1. Download the installer – Visit the official downloads page at https://antigravity.google and pick the installer for your operating system. Run the installer.
2. Initial setup – When the setup wizard appears:
3. Choose "Start fresh" instead of importing VS Code settings.
4. Select a theme (dark or light) – this just changes how the interface looks.
5. Pick an agent policy. The review-driven mode asks for confirmation before critical actions and is perfect for beginners.
6. Sign in with your personal Google account (Antigravity is currently in preview for personal Gmail accounts).
7. Configure your editor – Antigravity offers optional extensions, keybindings and a command-line tool called agy . You can accept the defaults or customise them later.

When installation is complete, Antigravity opens the Agent Manager window where you'll create tasks and monitor agents.

Project Walkthrough

Opening a workspace

Antigravity organises your work in workspaces, similar to folders. To set up the Itinerary Audio Bot:

1. Open Antigravity and, in the Agent Manager window, click "Open Workspace...".
2. Choose or create an empty folder where the project will live—Antigravity treats this as your working directory.
3. Copy the zipped project file (itinerary_audio_bot.zip) into this folder. You can drag and drop via your file manager or use Antigravity's built-in file browser.

Letting Antigravity set up the project

Here's where Antigravity shines. Instead of manually unzipping files and setting up environments, you'll delegate tasks to an agent:

1. In the Agent Manager, click + New Task and give it a title like "Set up itinerary bot".
2. In the task description, write a high-level prompt describing the goal, e.g.,

```
Prompt:
"Unzip the project zip file in the workspace, create a Python virtual
environment using Poetry, install the project dependencies, and run the
Gradio application. Follow the instructions in the README."
```

3. The agent will propose a plan, unzip, create a virtual environment, install dependencies and launch the Gradio interface, and ask you to review. Read through the plan; if something seems off, tweak your prompt and the agent will adjust.
4. When the agent asks to run a command (like poetry install), click Approve. This ensures the environment is set up exactly as documented (Python 3.10.12 or 3.12.6, Poetry and ffmpeg for audio support).
5. Finally, instruct the agent to run the Gradio script (chatbot_gradio_runner.py or equivalent). The agent will start a local server and open it in Antigravity's browser panel.

Interacting with the Itinerary Audio Bot

Once the Gradio app is running, Antigravity's Browser Preview panel shows the bot's interface. Try the following:

1. **Record your query** – Click the microphone icon and speak your travel request, e.g., "Plan a two-day trip to Goa with beach activities". Make sure to grant microphone permission and record in a quiet room.
2. **Edit the transcript** – Whisper converts your speech to text. A text box lets you fix any transcription errors.
3. **Submit** – Hit **Submit**. The underlying language model uses context from travel_bot_context.txt in the data folder to generate a personalised itinerary; the response appears in the chat window.
4. **Iterate** – Ask follow-up questions or adjust your request ("Suggest vegetarian restaurants"). The model will respond accordingly.
